units are excluded (see example "Bilateral Formation"), such cases of bilateral symmetrical units are not excluded (see example "Bach's No. 62"). See "Document Descriptionable Features."

It is a northern source (see that flower) southward across the Wood Mountains upland in Sanatogua through the Mingo Glacials-Fox Peak region in Montana, and even eastward to the Wolf Point-People region in the ill was deposited by northwestern source (see that flower) westward and southward from southwestern Manitoba and southwestern Saskatchewan into southwestern North Dakota and northwestern eastern Colorado in Montana (Allerton and others, 2000a,b). The Rider Butte till in Montana and the till of the Horsehoe Valley Formation (Fulton, 1970; or till E. Allerton, 1974, 1976) in McPherson County,

and 63.6% to Langenheim and others, 2000). The weighted mean of the most reliable K/H ages for the till is 64.7 ka (Jondrich, 1992). The Rockland typins stratigraphically overlie the Lavo Creek B Rock and others, 1992). The $^{40}Ar/^{39}Ar$ age of the Rockland ash bed is 64.4±0.5 ka (Langenheim and others, 1999). Therefore, that age is a minimum age for the Lavo Creek B typins. The preferred $^{40}Ar/^{39}Ar$ age of 63.6 ka (Langenheim and others, 2000). That age is adopted here.

Central glaciation is known to be represented by till in Montana and North Dakota. Other pre-Illinoian glaciation possibly are represented by till in the broad valleys of the ancestral Missouri and Yellowstone Rivers. Till of the Warman and Mazon Formations were identified in the fill in the broad Missouri River valley less than 2 km north of the International Boundary (Impresso Stratigraphic Section, #27), indicating that they are present in extreme northeastern Montana and extreme southwestern North Dakota.

and others, 1994; Pringle and others, 1995; Tsao and others, 1996 for the *Malaysian Bribes* polymorphic polarity reversal is the same as the mtDNA-based age for that reversal calculated by Tsao and others, 1996 for the *Javanese Malaya* reversal is the same as the mtDNA-based age assigned to that reversal by Berger and others (1994). An estimated $50\mu\text{g}/\text{kg}$ age of onset is assigned to the *Malaysian Bribes* reversal by Tsao and others (1996). An mtDNA-based age of 1.073 Ma was assigned to that reversal by Tsao and others (1996). An autosomal age of onset is assigned to the *Malaysian Bribes* reversal by Tsao and others (1996). An autosomal age of onset is assigned to the *Malaysian Bribes* reversal by Tsao and others (1996).
